

City Nature Challenge 2019

CITY NATURE CHALLENGE IS ORGANIZED BY

CALIFORNIA
ACADEMY OF
SCIENCES

Captive / Cultivated

CAPTIVE / CULTIVATED: What is it and when to use it.

iNaturalist is mainly used for observing 'wild' specimens, however the 'Captive/Cultivated' option allows users to state if the specimen has been 'planted' and/or if humans had 'intended' it to be there.

Here are some examples of the differences.

Wild/Natural

Trees/Flowers in a woodland
Fish in the sea or rivers
All animals except....

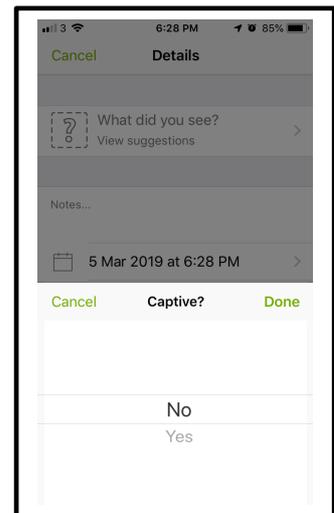

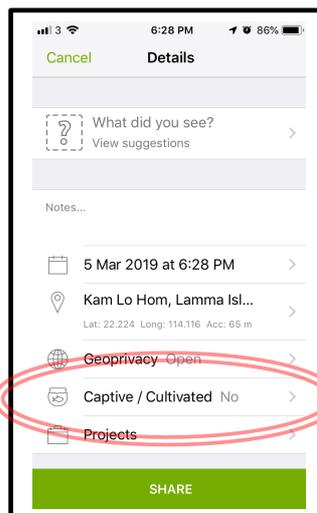

Captive/Cultivated

Trees/flowers in an urban park
Fish in a pond or tank
Farm animals or pets
Zoo or botanical garden animals

Highlighting observations as 'Captive/Cultivated' allows iNaturalist's data scientist partners to filter them out as they conduct research into 'wild' organisms

However, the **City Nature Challenge** allows **Captive/Cultivated** observations to be included in totals but wish to emphasize that 'wild' observations are more preferable for iNaturalist's database.

The **Captive/Cultivated** toggle can be found as you are putting in details for your observation. Please use it when necessary.
